Ameena Idrees

Supervised by: m.Fenk Dlawar Miran

# Content:

- Location of Site
- Site Analysis
- Sun Analysis
- Light Analysis of Single House
- Thermal Analysis of Building material
- Weather Analysis
- Heat gain calculation by occupants
- Heat gain calculation by ventilation
- Thermal resistance (U) and (R) value
- Problem and Solution

# Location of Site

## Location the Site in Erbil map

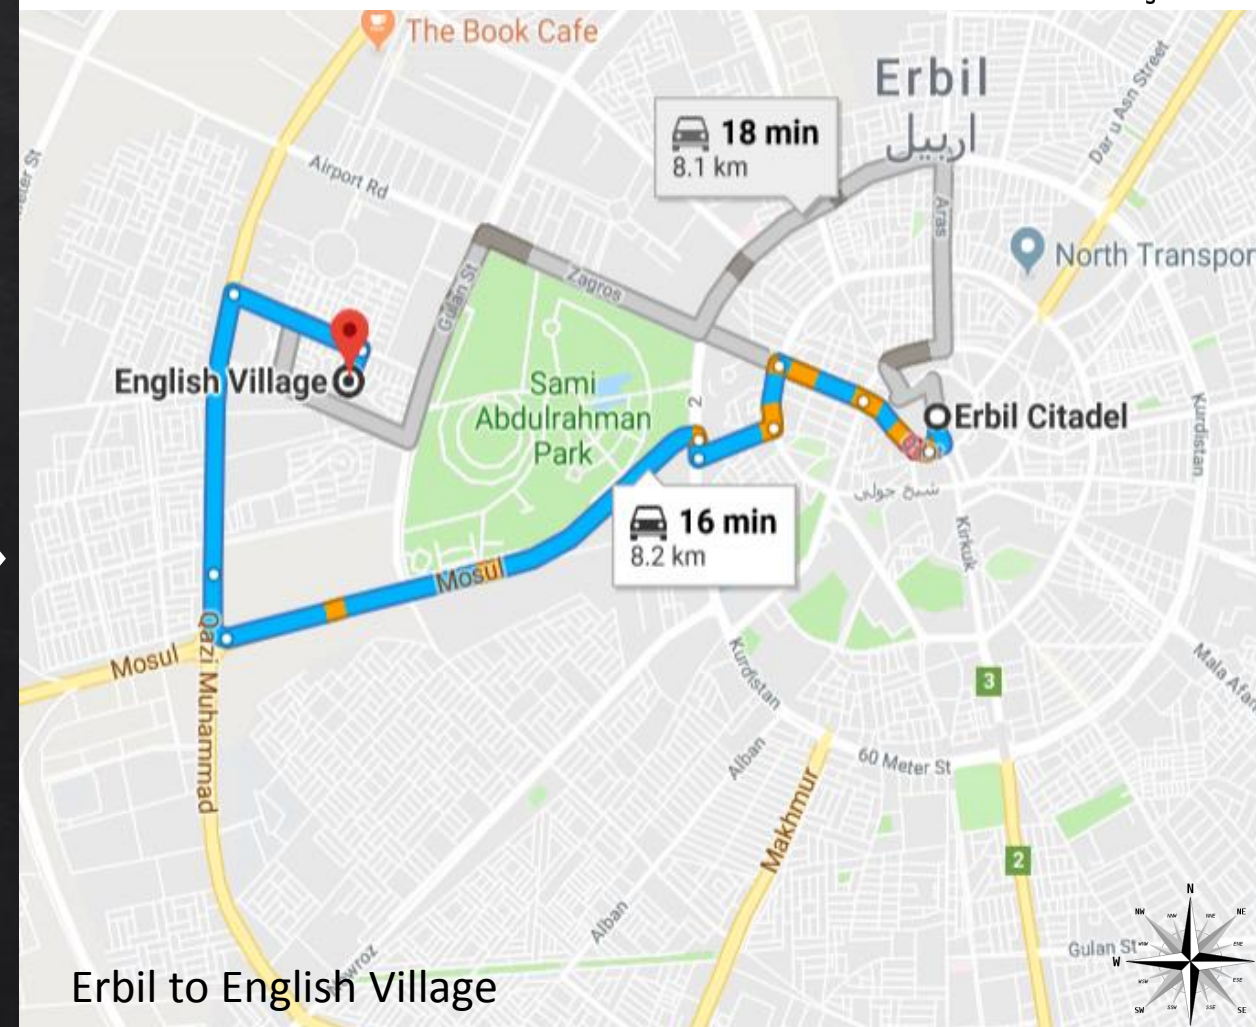

### *English Village (Erbil)*

Location: Iraq – Kurdistan Region – Erbil – Road Resort Salah al-Din – Bahrka.

Abstract of the project: Investment

License number: (190) at 28/07/2009

The project area: 300 acres

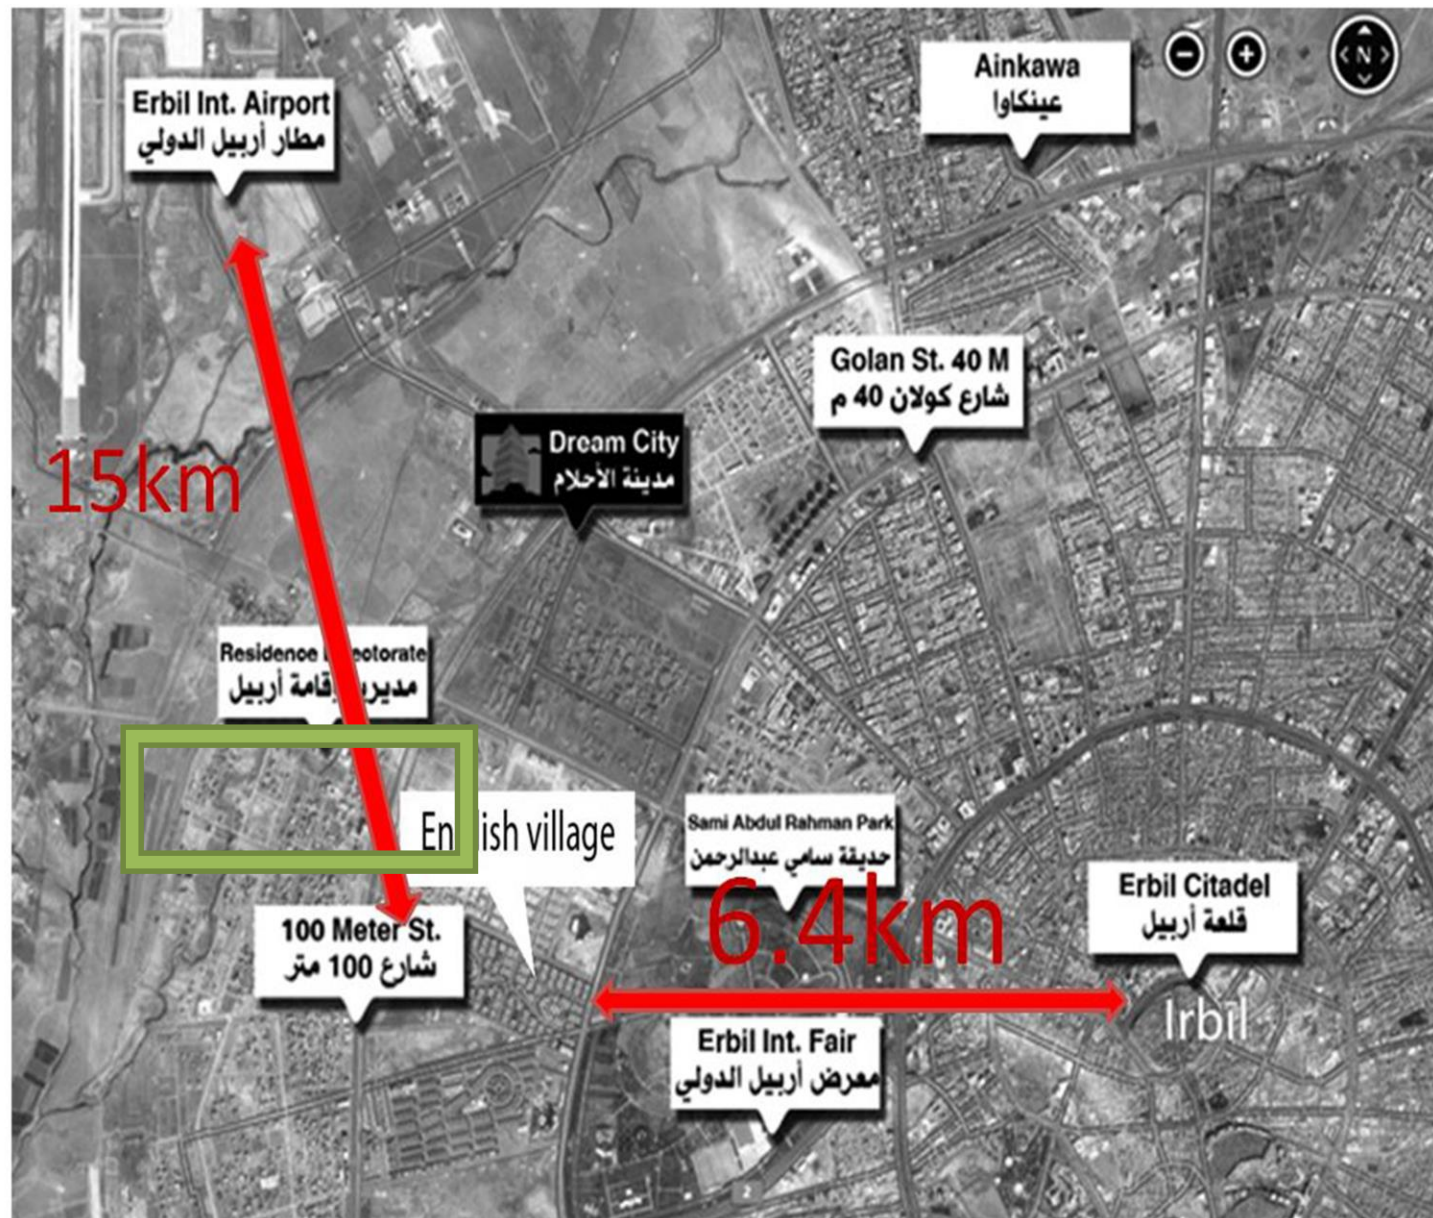

Erbil to English Village

# Location of Site

English Village in Erbil – Iraq is located between 100m and 40m roads at south of Erbil international airport , that 1.5km far from Erbil airport . Which is 6.4 km far from the city center.

## Location

-  Distance from airport is 1.5 km
-  Distance from center is 6.4 km

# Site Analysis

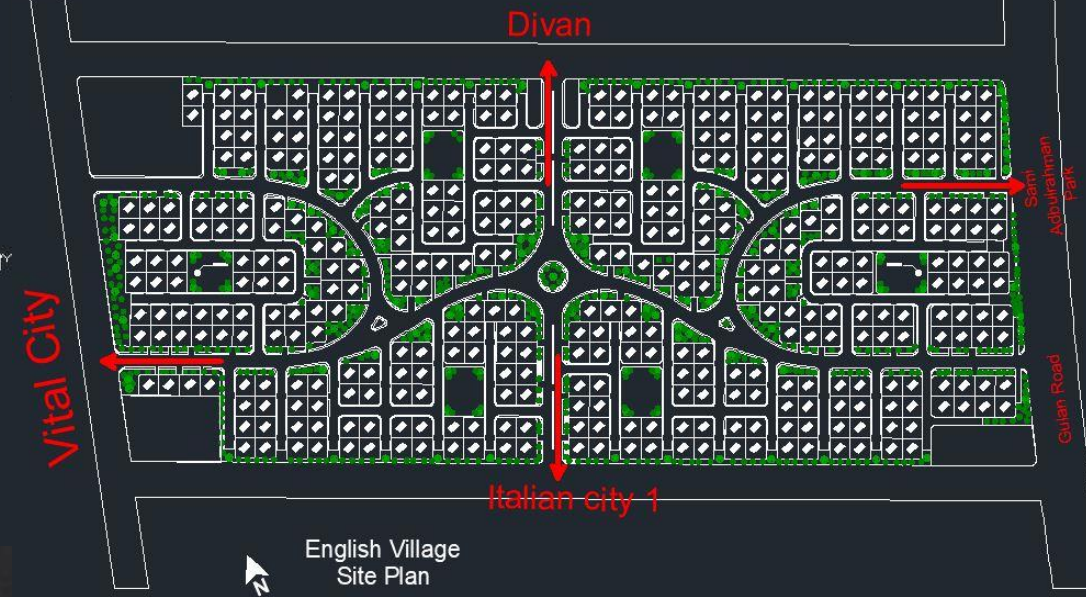

The English village Project spans a land area of 262,500 m<sup>2</sup>.

Building plot area: 63,350m<sup>2</sup>. (3 towers and 410 luxury villas.)

Total green area and roads: 106,485 m<sup>2</sup>.

## Ratio of window size to floor area, type of window

A window is an **opening** in a wall, door, roof or vehicle that allows the passage of light, sound, and air. Modern windows are usually glazed or covered in some other transparent or translucent material, a sash **set** in a frame in the **opening**, the sash and frame are also referred to as a window . The **importance** of home **windows**, **Windows** provide our homes with light, warmth, and ventilation, but they can also negatively impact a home's energy efficiency. ... Adding storm **windows** can reduce air leakage and improve comfort. **Energy efficient windows** are an important consideration for both new and existing homes. Heat gain and heat loss through **windows** are responsible for 25%–30% of residential heating and cooling **energy** use

# Structure & material

Thermal mass is the ability of a material to absorb and store heat energy. A lot of heat energy is required to change the temperature of high density materials like concrete, bricks and tiles. They are therefore said to have high thermal mass. Lightweight materials such as timber have low thermal mass.

## Thermal Mass

Brickwork, by the virtue of its high bulk density, has a corresponding large thermal capacity, with the ability to absorb and store a significant quantity of heat during periods of daytime, increasing temperature, and to isolate this heat in a controlled manner during periods of right time decreasing temperature

# Heat gain calculation by occupants

## 1-Kitchen (2person)

Sensible head gain=78.5w

Latent heat gain =78.5w

$$\text{Total sensible heat gain} = \frac{2*78.5}{1000} = 0.157\text{kw}$$

$$\text{Total latent heat gain} = \frac{2*78.5}{1000} = 0.157\text{kw}$$

$$\text{Total heat gain} = 0.157+0.157=0.314\text{kw}$$

## 2-Dining (6person)

Sensible head gain=70w

Latent heat gain =44w

$$\text{Total sensible heat gain} = \frac{6*70}{1000} = 0.42\text{kw}$$

$$\text{Total latent heat gain} = \frac{6*44}{1000} = 0.264 \text{ kw}$$

$$\text{Total heat gain} = 0.42+0.264= 0.684\text{kw}$$

## 3-Reception (6person)

Sensible head gain=70w

Latent heat gain =44w

$$\text{Total sensible heat gain} = \frac{7*70}{1000} = 0.49\text{kw}$$

$$\text{Total latent heat gain} = \frac{7*44}{1000} = 0.308 \text{ kw}$$

$$\text{Total heat gain} = 0.49+0.308 = 0.798 \text{ kw}$$

## 4-BATH(person)

Sensible head gain=64w

Latent heat gain =30w

$$\text{Total sensible heat gain} = \frac{1*64}{1000} = 0.064\text{kw}$$

$$\text{Total latent heat gain} = \frac{1*30}{1000} = 0.03 \text{ kw}$$

$$\text{Total heat gain} = 0.03 + 0.064 = 0.094 \text{ kw}$$

## 5-Bedroom (2person)

Sensible head gain=64w

Latent heat gain =30w

$$\text{Total sensible heat gain} = \frac{2*64}{1000} = 0.128\text{kw}$$

$$\text{Total latent heat gain} = \frac{2*30}{1000} = 0.060 \text{ kw}$$

$$\text{Total heat gain} = 0.128+0.060 = 0.188 \text{ kw}$$

## 6-Bedroom (1person)

Sensible head gain=64w

Latent heat gain =30w

$$\text{Total sensible heat gain} = \frac{1*64}{1000} = 0.064\text{kw}$$

$$\text{Total latent heat gain} = \frac{1*30}{1000} = 0.03 \text{ kw}$$

$$\text{Total heat gain} = 0.064+0.03 = 0.094 \text{ kw}$$

**Total heat gain of the house =2.172kw**

# Thermal resistances for surfaces (U) and (R) value

Layer	Resistance /m2kw-1
Inside surface (R <sub>s</sub> )	0.13
Air gap	0.18
Outside surface (R <sub>s</sub> )	0.04

Layer	thickness/m	conductivity	Resistance
Outside thermal resistance			0.04
marble	0.05m	2.08	0.05/2.08=0.024
brick	0.28m	0.7	0.28/0.7=0.4
internal plaster	0.02m	2	0.02/2=0.01
Inside thermal resistance			0.13
Total thermal resistance			0.564

The overall U-value is then  $U=1/R$   $1/0.564=1.77$

## Ventilation calculate :

$$V=897.6 \text{ m}^3$$

$$CV=1300\text{J}/\text{M}^3.\text{C}$$

$$\text{Outside temperature} = 30 \text{ C}$$

$$\text{Inside temperature} = 25 \text{ C}$$

$$\Delta T = 30 - 25 = 5 \text{ C}$$

$$\text{Air change/hr} = 0.5$$

$$QV = CV * V * \Delta T$$

$$= 1300 * \frac{(0.5 * 897.6)}{(3600)} * 5$$

$$QV = 810 \text{ Watt}$$

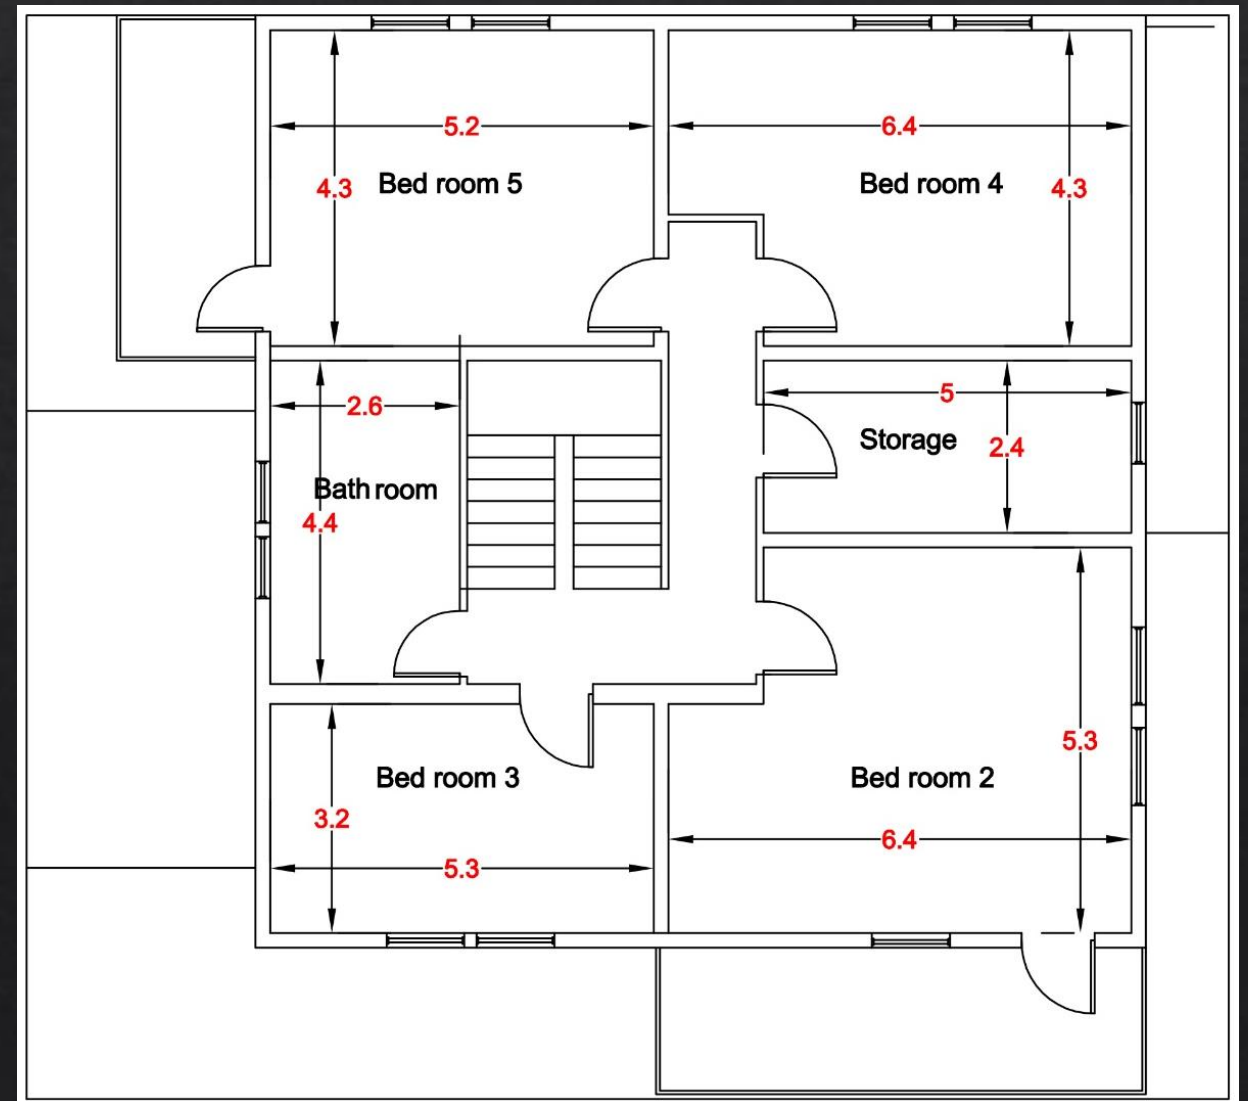

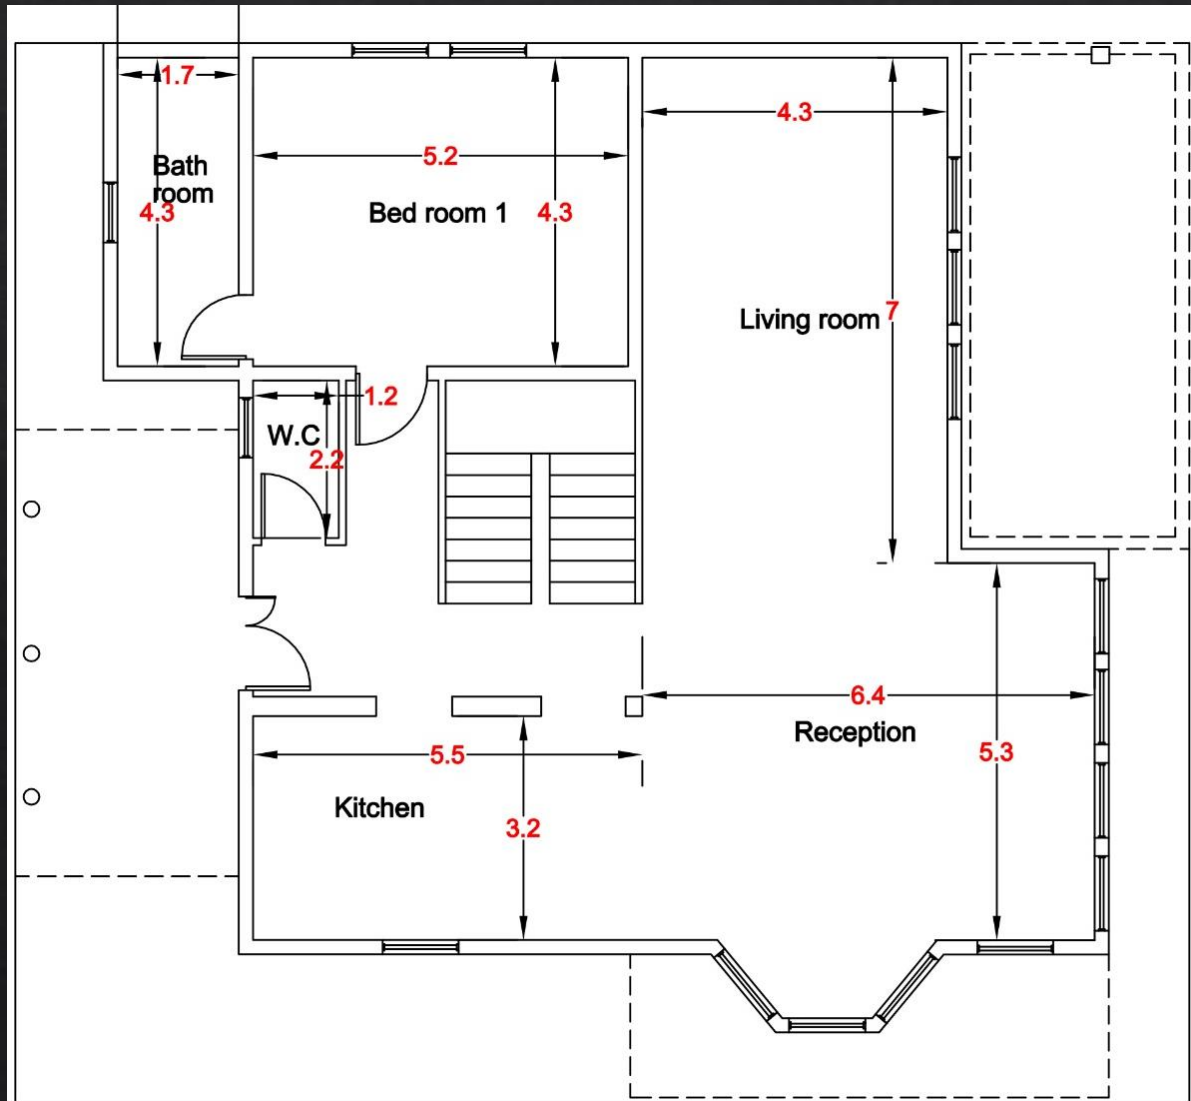

# Typical Air changes per hour :

## ground floor

kitchen	$5.5 \times 3 = 17.6$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{17.6} = 1022.73$
reception	$6.4 \times 5 \times 3 = 33.92$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{33.92} = 530.66$
living room	$7 \times 4.3 = 30.1$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{30.1} = 598.01$
bed room1	$5 \times 2.4 \times 3 = 22.36$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{22.36} = 805.01$
bath room	$4.3 \times 1.7 = 7.31$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{7.31} = 2462.38$
wc	$2.2 \times 1.2 = 2.64$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{2.64} = 6818.18$

## first floor

bed room2	$6.4 \times 5 \times 3 = 33.92$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{33.92} = 530.66$
bed room3	$5.3 \times 3 \times 2 = 17.6$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{17.6} = 1022.73$
bed room4	$6.4 \times 4.3 = 27.52$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{27.52} = 654.07$
bed room5	$5 \times 2.4 \times 3 = 22.36$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{22.36} = 805.01$
bath room	$4.4 \times 2.6 = 11.44$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{11.44} = 1573.43$
storage	$5 \times 2.4 = 12$	air changes/hr = $\frac{CFM \times 60 \text{min}}{\text{Volume of room}} = \frac{300 \times 60}{12} = 1500$

# Problem & Solution

-The project have a low passive solar heating and shading device.

solar control and shading can be provided by a wide range of building components including:

.Landscape features such as mature trees or hedge rows.

.Exterior elements such as overhangs or vertical fins.

.Horizontal reflecting surfaces called light shelves.

.Low shading coefficient (SC) glass.

.Interior glare control devices such as Venetian blinds or adjustable louvers.

-They used wood in some of the villas , Wood That Burns as a hard, fibrous material composed mostly of cellulose and lignin, the wood releases its heat quickly.

Sedimentary Sand. ...

Expanded Polystyrene. ...

The Air Breathed.

Prefer used Concrete instead of wood because **Concrete** has a high thermal mass with properties similar to brick and stone. It is possible to absorb **heat** from the atmosphere in warm weather and release it during cooler periods, e.g. overnight.

-The Houses have a low ventilation because the kitchen open to the living room.

To increase ventilation in the house we should do:-

.Create **cross-ventilation** ,it is important because it pushes warm air, together with the circulating dust and pollutants, out of the **home** and allows fresher and cooler air to enter. .Keep it clean and cool. Regularly clean your air-con filters — at least once every quarter.

.Purify naturally.
